

Rooms – What We Have vs What We Need (v2 Parser Era)

What we have (typical legacy):

- id, name, description
- exits as plain strings or simple mappings
- basic object lists present in the room

What we need (to support v2 intents, puzzles, NPCs):

1) Exits as typed records:

- id, to_room_id, type: door/airlock/hatch/portal
- state: open | closed | locked
- requires: key/tool object_id (optional)
- interactions: openable, lockable (bool flags)

2) Door/Exit ownership:

- If modeled as objects: link exit → object_id
- If inline exits: keep minimal state fields above

3) NPC hooks:

- allowed_npcs: [npc_id] (who can spawn/idle here)
- guard_npc_id (optional) blocks locked exits

4) Puzzle hooks:

- puzzle_tags: [tag] (rooms linked to puzzles/steps)
- on_enter events (optional) for puzzle triggers

5) Observation text:

- look_text (default room description)
- scan_text (optional: for SCAN/READ style actions)

Room checklist (add without breaking legacy):

- [] exits[] with: id, to_room_id, type, state, requires?
- [] link exit → object_id OR keep inline state
- [] guard_npc_id/allowed_npcs if needed
- [] puzzle_tags / on_enter hooks
- [] look_text / scan_text
